

# Logical Interaction Viewpoint

Domain: Logical Aspect: Interaction and Collaboration

## Example

## Purpose

The Logical Interaction Viewpoint describes system internal behavior based on the exchange between the logical component(s) of the SOI. It depicts the sequence of interactions between the logical components and the exchanged data item(s) needed to accomplish a given system function.

## Applicability

The Logical Interaction Viewpoint supports the "Develop Architecture Viewpoints" and the "Develop Models and Views of Candidate Architectures" activity included in the "Architecture Definition process" activities of the INCOSE SYSTEMS ENGINEERING HANDBOOK 2015 [§ 4.4] and contributes to the artifact "System Architecture Description". Note:

## Stakeholder

---

- [Hardware Developer](#)
- [IV&V Engineer](#)
- [Mechanic Developer](#)
- [Regulation Authority](#)
- [Safety Expert](#)
- [Security Expert](#)
- [Software Developer](#)
- [Supplier](#)
- [System Architect](#)

## Concern

---

- What kind of information is exchanged and processed within the system?
- What is the necessary response time for an interface or a service?
- How do internal system elements interact with each other to provide the system function or service?
- What are the items exchanged between the logical system elements during the interaction?
- How does the system or a system element interact with the test environment?
- What additional information the system or a system element needs to generate to enable testing?

## Presentation

---

The Logical Interaction Viewpoint is modeled as a sequence diagram. It describes the flow of control between logical components of the SOI. This diagram represents the sending and receiving of messages between the interacting entities called lifelines where time is represented along the vertical axis. The elements on the lifelines are part properties typed by logical system elements.
