

# **Physical Context Definition Viewpoint**

Domain: Physical Aspect: Context & Exchange

## **Example**

none

### **Purpose**

The physical context definition Viewpoint identifies the different context the SOI is used in, along with the associated external entities sharing a physical interface with the SOI. For each context the applicable environmental conditions may be defined. The physical context helps in discovering the interface requirement(s) needed to integrate a SOI into its environment in a specific context. NOTE: For each candidate SOI architecture, the physical context Viewpoint is elaborated forming the baseline for the later assessment of the different system architecture solutions.

## **Applicability**

The physical context definition Viewpoint supports the "Architecture Definition Process" activities of the INCOSE SYSTEMS ENGINEERING HANDBOOK 2015 [§ 4.4]. The Viewpoint is used to define context, boundaries, and external interactions of the SOI in the physical domain. NOTE: Only those external entities are identified that share a physical interface. Other entities connected via a network are subject of the logical system context.

#### Stakeholder

- Acquirer
- Customer
- IV&V Engineer
- System Architect

#### Concern

- How does the system or a system element interact with the test environment?
- What are necessary enabling systems?

- What are the external physical entities the system interacts with in the respective context?
- What is the system boundary definition?
- What kind of test equipment is necessary to test the system elements?

#### **Presentation**

The following artifact(s) support the modeling activities: A) The physical context definition diagram defines the elements available in the context. At least one context definition diagram is generated per identified context. For each identified context a BDD featuring:

- one block representing the Physical SOI
- one block representing the Physical System Context
- several blocks representing Physical Context Elements such as Physical User, Physical External System, and Physical Environment present in the systems context
- composition relationship(s) attaching the Physical Context Elements and the Physical SOI to the Physical System Context block
